Preface

This preface introduces information sources that can help you use the application.

Oracle Applications Help

Use the help icon (?) to access Oracle Applications Help in the application. If you don't see any help icons on your page, click the Show Help icon (?) in the global header. Not all pages have help icons. You can also access Oracle Applications Help at https://fusionhelp.oracle.com.

Using Applications Help

Watch: This video tutorial shows you how to find help and use help features.

Additional Resources

- Community: Use Oracle Applications Customer Connect to get information from experts at Oracle, the partner community, and other users.
- Guides and Videos: Go to the Oracle Help Center to find guides and videos.
- Training: Take courses on Oracle Cloud from Oracle University.

Documentation Accessibility

For information about Oracle's commitment to accessibility, see the Oracle Accessibility Program .

Comments and Suggestions

Please give us feedback about Oracle Applications Help and guides! You can send e-mail to: oracle_fusion_applications_help_ww_grp@oracle.com.

1 Overview

About This Guide

This guide is intended for advanced users and administrators who want to modify and create custom analytics and reports, as well as perform setup and maintenance tasks for business intelligence. The guide contains both conceptual and procedural information intended to help you build and manage analyses, reports, and dashboards that are tailored to the content needs of your line of business or company. You can also use the information in this guide to help you set up business intelligence.

Creating and Administering Procurement Cloud Analytics and Reports: Overview

Business intelligence enables you to analyze data to gain insight that you can act on, gathering information to meet specific requirements. You can use different types of predefined analytics and reports, or create and edit them, to support your business needs.

Types of Business Intelligence

This table describes the purpose of analytics and reports.

Туре	Description	Purpose
Analysis	An interactive display of data, for example in a table or graph.	To summarize or break down simple, real- time data, and help you make short-term decisions.
Dashboard	A collection of analyses and other content, presented on one or more pages, or tabs.	To get various pieces of information about a particular subject.
Report	Output of data in a readable, predefined format.	To get high-volume data in an output optimized for printing, including documents to support internal operations, statutory requirements, and other business needs.

For a list of predefined analytics and reports, see Oracle Procurement Cloud View Procurement Reports and Analyses on the Oracle Help Center.

Customization of Analytics and Reports

You can create and edit analytics and reports for your own use. Or, if you have the appropriate roles, you can customize for others. For example, you can:

- Add or remove columns from an analysis.
- Change the branding logo on report output.
- Create a dashboard to include your most commonly viewed analyses.

Setup and Administration

Administrators perform setup and administration tasks to manage how you or how other users use and customize analytics and reports. For example, you can:

- Configure Oracle Business Intelligence Publisher, the tool used for generating and customizing reports.
- Define flexfields to provide custom attributes that can be used in analyses.
- Archive analytics and reports and move them from one environment to another.

For a list of setup reports, see Oracle Procurement Cloud View Setup Reports and Analyses on the Oracle Help Center. It provides details for all of the setup reports and analyses for Cloud applications, each of which you can customize to meet your company's requirements.

Securing Procurement Analytics and Reports: Overview

All users with appropriate roles can create and access analyses and reports based on role access to subject areas and catalog folders.

Analyses and reports are secured by applying job roles with associated duty roles to users. Duty role assignments determine access to subject areas for analyses as well as catalog folders. For information about the job and duty roles provided with Procurement Cloud, see the Oracle Procurement Cloud Security Reference guide. For information about how to customize your security model by creating custom job roles and assigning duty roles to them, see the Oracle ERP Cloud Securing Oracle ERP guide.

In addition to folder and object access, duty roles also determine data security. Each of the duty roles that provides access to subject areas and catalog folders is granted one or more data security policies that allow access to the data.

How can I find analytics and reports?

See if the analysis or dashboard already appears on your page, maybe on a separate tab. Or there might be, for example, a link to the report you want to use. Also look for the Reports and Analytics pane, which may appear on your work area as a panel tab or in the regional area. In the pane, you find analytics and reports specific to the work area you're on.

To see all the analytics and reports that you have access to, use the Reports and Analytics work area (**Navigator - Tools - Reports and Analytics**).

Reports and Analytics Pane: Explained

The Reports and Analytics pane is a central place for you to quickly view or run analytics and reports that are related to your work. If you have the permission, you can create and edit analytics and reports here, or add them from the business intelligence (BI) catalog to the pane. You may find this pane in a panel tab or in the regional area on some work areas. In the Reports and Analytics work area (**Navigator - Tools - Reports and Analytics**), the pane appears as the Contents pane.

What's In the Pane

This table describes what's in the top level folders of the Reports and Analytics pane.

Folder	Content
My Folders	Any custom analyses or reports that you saved for your own use only.
Shared Folders	 Any predefined analyses and reports that are relevant to your role. Or, in the Reports and Analytics work area, all the analytics and reports that you have permissions to access.
	Any shared custom reports and analytics in the Custom subfolder. Place your shared reports and analytics in this folder to protect them during upgrades.

Business Intelligence Catalog: Explained

Reports, analyses, dashboards, and other business intelligence (BI) objects are stored and administered in the business intelligence catalog.

Navigating to the Catalog

To navigate to the catalog:

- 1. Click **Reports and Analytics** under **Tools** in the Navigator.
- 2. In the Reports and Analytics pane, click the **Browse Catalog** icon.

Identifying Objects in the Catalog

The catalog stores the BI objects in a directory structure of individual files, organized by product family.

Bl objects and reports are organized in the following folder hierarchy:

- Shared Folders (top level)
- Product family (example: Financials)
- Product (example: Payables)
- Report groups (example: Invoices)
- Dashboard reports
- Data Models
- Report Components
- BI Publisher reports
- Prompts

The following table describes the common BI objects that you find in the catalog:

Description	Location
Analyses are used primarily by dashboards.	Report Components folder
Dashboards organize analytical content and catalog objects, and present them in a meaningful way.	Reporting group folder
Dashboard prompts allow users to filter dashboard content using provided values.	Prompts folder
Filters are used in dashboards and analyses.	Prompts folder
Reports are operational reports created in Business Intelligence Publisher.	Reporting group folder
Subtemplates are used by reports created in Business Intelligence Publisher.	Data Models folder
Data models are used by reports created in Business Intelligence Publisher.	Reporting group folder
	Analyses are used primarily by dashboards. Dashboards organize analytical content and catalog objects, and present them in a meaningful way. Dashboard prompts allow users to filter dashboard content using provided values. Filters are used in dashboards and analyses. Reports are operational reports created in Business Intelligence Publisher. Subtemplates are used by reports created in Business Intelligence Publisher.

Saving Analytics and Reports: Points to Consider

You save analyses, dashboards, and reports in the business intelligence (BI) catalog, along with other objects, including prompts and filters. The catalog has a hierarchy of folders, with My Folders and Shared Folders at the top. One important folder is Custom, which you find under Shared Folders and use to store your custom analytics and reports.

My Folders

You're the only one who can access anything that you save in My Folders. You can see your saved items in My Folders on the Reports and Analytics work area, but not in My Folders in the Reports and Analytics pane on any other work area. The only exception is when you create an analysis using the wizard in the Reports and Analytics pane, and save it in My Folders. In this case, the analysis is available in the pane on all work areas.

Shared Folders

If you have the appropriate roles, you can also save in Shared Folders so that your custom analytics or reports are available to anyone with the right access. You should save objects under the Custom subfolder, which has subfolders organized by product family.

Regarding predefined analytics and reports in Shared Folders:

- You should save a copy of the predefined analysis or dashboard in the corresponding product family subfolder under the Custom folder, and edit only the copy. Directly edit predefined analytics only when necessary, to make sure that any references to the analysis or dashboard still work properly.
- For predefined reports only, you can use a special Customize option to copy the report and also the folder structure and permissions. The copy is linked to the original, so editing the copy is like directly editing the original.

Custom Folder

Keep all custom analytics and reports in the Custom folder so that:

- You ensure that customized copies of those objects are not affected during upgrades, which can change predefined
 analytics and reports outside the Custom folder. You might lose customizations saved outside the Custom folder
 during upgrades.
- You can easily find customized objects.
- You can edit objects in the Custom folder without compromising security on the original objects.

When you copy an object into the Custom folder, the copied object inherits the permission settings of the Custom folder. An administrator can reset the permissions on the object and the folder that it's in.

Related Topics

- Creating and Editing Reports: Explained
- Creating and Editing Analytics: Highlights
- Using the Customize Option for Predefined Reports: Points to Consider

What happens to customized analytics and reports when a patch is applied?

All custom analytics and reports are preserved if you save them in the Custom subfolder within Shared Folders, or in My Folders in the business intelligence (BI) catalog. Changes to predefined analytics and reports outside the Custom folder are preserved only if the patch doesn't include a new version of those BI objects. If the patch does include a new version of a predefined object that you edited outside the Custom folder, then:

- The new version overwrites the existing predefined object.
- A copy of the existing object (with your edits) is automatically created in the same folder, with a new name that indicates it's a custom version.

If the patch includes a new version of both the predefined object and a folder in its file path, then:

- The new folder, along with the new version of the object, overwrites the existing predefined folder and object.
- A copy of the existing folder (along with your edited object) is automatically created. The folder is renamed to indicate that it's a custom version, but your edited object is not renamed.
- Note: Future patches won't affect renamed custom objects or anything within a renamed custom folder.

Setup and Administration Overview

Tools for Administering Analyses and Reports: Explained

You can use several different tools to manage and administer analyses and reports.

These components support modification and administration of your analyses and reports:

- Use the Business Intelligence catalog to interact directly with your reports and analyses. Use this interface to manage permissions, properties, and the organization of your analyses and reports.
- Use the Oracle Business Intelligence Publisher administration pages to configure settings specific to the running and scheduling of operational reports, such as setting up your delivery servers, managing scheduler work load, and setting run-time properties for reports.
- Use the Oracle BI Administration Tool to edit the Oracle BI repository (RPD), which contains the metadata upon which reports and analyses are built. The Administration Tool is a Windows application that you use to edit the RPD based on your requirements. You can use the Administration Tool to perform data modeling tasks such as adding new fact or dimension tables, reorganizing Presentation layer metadata, and creating BI view objects for tables. This tool isn't available in Oracle Cloud implementations.
- Use the Catalog Manager to perform online and offline management of the catalog. Tasks that you can perform with the tool include managing folders, shortcuts, global variables, and Oracle BI objects such as analyses, filter, prompts, and dashboards; viewing and editing catalog objects in XML, and searching for and replacing catalog text. This tool isn't available in Oracle Cloud implementations.

• Use the Oracle Enterprise Manager Cloud Control to monitor your IT environment unattended. It's delivered with a predefined set of performance and health metrics that enable you to monitor key environment components, access real-time performance charts, and perform strategic tasks such as trend analysis and reporting. This tool isn't available in Oracle Cloud implementations.

Define Transactional Business Intelligence Configuration: Overview

Use the Define Transactional Business Intelligence task list in the Setup and Maintenance work area to complete configuration of business intelligence in your application. Some tasks in this task list are performed during Oracle Applications Cloud provisioning and require no further action from you. The Define Transactional Business Intelligence Configuration task list includes the following tasks:

- Optimize Transactional Business Intelligence Repository
 - Trim unused projects from the business intelligence repository based on configured Oracle Applications Cloud offerings. This optimization is automated during the provisioning process and requires no further action from you.
- Manage Transactional Business Intelligence Connections
 - Review data source connections in the physical layer of the business intelligence repository. Connections are set up and reviewed during the provisioning process, and this task requires no further action from you.
- Manage Security for Transactional Business Intelligence
 - Review security for business intelligence users. The default security configuration can be modified. Refer to the security documentation for your cloud services to review or change the default user security model.
- Configure Key Flexfields for Transactional Business Intelligence
 - Define the key flexfield segments and validation for use as classification keys. You must define these key flexfields for Oracle Fusion Transactional Business Intelligence to operate correctly.
- Configure Descriptive Flexfields for Transactional Business Intelligence
 - Define validation and display properties of descriptive flexfields, which are used to add custom attributes to entities. You enable and import flexfields for use in analyses.
- Import Essbase Cubes into Transactional Business Intelligence Repository for Financials General Ledger
 - Import Essbase cubes into the business intelligence repository. You must perform this task if you're using Oracle Fusion General Ledger.
- Manage User Currency Preferences in Transactional Business Intelligence
 - Manage user currency preferences, which control regional currency settings, currency used in reports, and corporate currency.

2 Setup and Configuration

Mapping to Work Areas

Setting Up the Reports and Analytics Pane: Procedure

You can find the Reports and Analytics pane in many work areas, and the analytics and reports you see in the pane depends on the work area. You can define what's available for a specific work area, by mapping reports from the business intelligence (BI) catalog to that work area. In this mapping context, reports refer to both analytics and reports. Your changes apply to all users who have access to the work area you're mapping.

Mapping Reports from Your Work Area

To map reports to the work area that you're in:

1. Click the **Edit Settings** icon in the Reports and Analytics pane.

You see all the reports that are currently mapped to your work area.

- 2. Click Select and Add.
- 3. Find the report in the catalog and select it.
- 4. Click OK.
- 5. To remove any mapping, select the report and click **Remove**.
- 6. Save your work.

Mapping Reports to Any Work Area

To map reports to any work area that you have access to:

- Go to the Setup and Maintenance work area and open the Map Reports to Work Areas task.
- 2. Select the application of the work area you want to map to.
- 3. Select the work area.
- 4. Click **Search** and see all the reports that are currently mapped to that work area.
- 5. Click Select and Add.
- 6. Find the report in the catalog and select it.
- 7. Click OK.
- 8. To remove any mapping, select the report and click **Remove**.
 - Tip: Click Synchronize to remove all mappings to any reports that are no longer in the catalog. You synchronize all work areas, not just the one you're mapping.
- 9. Save your work.

Related Topics

- Setting Reports Up for Scheduling in the Reports and Analytics Pane: Procedure
- · Reports and Analytics Pane: Explained

Why can't I see reports when mapping reports to work areas for the Reports and Analytics pane?

Either no reports are currently mapped to the work area you select on the Map Reports to Work Areas page, or you don't have access to the reports that are mapped.

Similarly, when you're selecting a report to map, you can see only the reports that you have access to. Ask your administrator to either:

- Assign you roles that have access to the reports you want to map to work areas.
- Grant the Reports and Analytics Region Administration Duty to someone who already has access to those reports.

Why can't I see reports when I edit settings for the Reports and Analytics pane?

In the Edit Settings window, you might not see a currently mapped report because you don't have access to it.

Similarly, when you're selecting a report to map, you can see only the reports that you have access to. Ask your administrator to either:

- Assign you roles that have access to the reports you want to map to work areas.
- Grant the Reports and Analytics Region Administration Duty to someone who already has access to those reports.

Setting Up Currency

Why do I see amounts of zero in analyses?

The currency exchange rates might not be set up correctly. For example, you choose EUR as your preferred currency in general preferences, and your corporate currency is USD. Amounts in analyses are displayed in EUR after conversion from USD, based on the current exchange rate. But if the exchange rate between EUR and USD isn't set up, or if the conversion fails for any reason, then the amounts show as zero. If this happens, contact your help desk.

Configuring Business Intelligence Publisher

Managing Report Delivery Servers: Overview

Oracle Business Intelligence Publisher, the report generation and delivery engine, requires configuration and tuning to deliver reports to users.

Report requests are received by Publisher from:

Oracle Enterprise Scheduler

- The Reports and Analytics pane
- Application pages

Requests submitted through Oracle Enterprise Scheduler are processed by the Oracle BI Publisher scheduler. Requests submitted through the Reports and Analytics pane can be either real-time online requests or scheduled requests. Requests submitted through an application may invoke Oracle Enterprise Scheduler or may return report request results directly back to the application page.

Oracle BI Publisher is configured to accept requests from Oracle Applications Cloud. However, before you can deliver report documents to their destinations, you must define the delivery servers in Oracle BI Publisher. Use the Oracle BI Publisher Administration page to define your delivery servers.

Once delivery servers are defined, you can further configure the number of report processor and delivery threads to best handle your processing and delivery requirements. In addition, you can configure report properties for the system or at the report level to tune performance of your reports. To diagnose report processing issues, BI Publisher provides a set of scheduler diagnostics.

Navigating to the Oracle BI Publisher Administration Page: Procedure

You use the Oracle BI Publisher Administration Page to perform most tasks related to report delivery and performance.

Use the Oracle BI Publisher Administration page to:

- Configure delivery servers
- Manage report and delivery processors
- View scheduler diagnostics
- Set system properties and report runtime configuration properties

Request the Oracle Applications Cloud security administrator to assign the BI Platform Administrator duty role (BI stripe) to the person responsible for administering BI analyses, dashboards, and BI Publisher reports. Administration tasks include security permissions for objects, organizing objects into folders, accessing log files, and several other tasks.

Navigating to the Administration Page

To navigate to the Oracle BI Publisher Administration page:

- 1. Under Tools, click Reports and Analytics.
- 2. In the Reports and Analytics pane, click **Catalog**.
- 3. In the Catalog page, click **Administration**, then click **Manage BI Publisher**.

Configuring Report Delivery Servers: Procedure

Set up the report delivery servers to support printing.

Configuring Servers

To configure delivery servers:

- 1. From the BI Publisher Administration page, click **Delivery Configuration**.
- 2. Enter values in the Delivery Configuration Options tab to set general properties for email deliveries and notifications.
- 3. To configure a delivery server, click the appropriate tab.

Understanding the Report and Delivery Processors: Overview

When Oracle Enterprise Scheduler initiates a job, it is picked up by the BI Publisher scheduler queue.

- Job Processor: Listens for requests from the scheduler queue. When the job information is received, the job processor executes the data model (and splits the data for bursting jobs), stores the data in the shared temporary folder, and sends the report metadata to the report queue.
- Report Processor: Listens for requests from the report queue. When the report information is received, the report processor generates the report documents, stores it in the shared temporary folder and puts the delivery information in the delivery queue.
- Delivery Processor: Listens to the delivery queue and handles the delivery of reports for its channel. The delivery processors are:
 - Email Processor
 - File Processor
 - FTP Processor
 - Print Processor
 - WebDAV Processor
 - Fax Processor

Managing Report Processing and Delivery Server Load: Procedure

Manage the processors in the BI Publisher Scheduler Configuration page.

Managing Processing and Server Load

By default, each processor is enabled and the thread count for each is set to five. For each managed server that is running in the BI cluster, a table for that instance's processors is displayed. Use the table to enable or disable processors for the instance and configure the thread counts.

To configure processor threads:

- 1. From the BI Publisher Administration page, click **Scheduler Configuration**.
- 2. In the Cluster Instances region of the Scheduler Configuration page, enter the Number Threads value in the processor configuration table.
- 3. All processors are automatically set to use the number of threads defined in the Threads Per JMS Processor value of the JMS Configuration region of the page. Enter a value in the Number Threads column to change the value from this default.

After performing the scale-out procedure, configure the processor threads for each cluster instance using the steps above.

Diagnosing Report Processing Issues: Procedure

The Scheduler Diagnostics page provides the runtime status of the scheduler. It provides status of its JMS configuration, JMS queues, cluster instances, scheduler Database, Top link, and Oracle Enterprise Scheduler.

Diagnosing Issues

To access the Scheduler Diagnostics page:

- 1. Navigate to the Oracle Business Intelligence Publisher **Administration** page.
- 2. In the System Maintenance group, click **Scheduler Diagnostics**.

Configuring System Properties for Reports: Procedure

Use the Oracle BI Publisher Runtime Configuration page to set the system-level runtime properties for reports.

Configuring Reporting Properties

To access the Runtime Configuration page:

- 1. Navigate to the Oracle Business Intelligence Publisher **Administration** page.
- 2. In the Runtime Configuration group, click Properties.

Uploading PGP Public Key Files to GPG Keystore: Procedure

To support encrypted communication channel from the BI Publisher Server to an FTP site, you upload a PGP public key file to a GPG keystore on the cloud and then provide it to a registered FTP location.

Uploading PGP Keys

You upload, test, and delete PGP keys in the BI Publisher Administration page.

To upload PGP keys:

- 1. Navigate to the BI Publisher Administration page.
- 2. In the Security Center section, click the PGP Keys link to open the PGP Keys page.
- 3. In the PGP Keys section, click **Browse** and select the PGP key file in the Open dialog box.
- 4. Click OK.
- 5. Click **Upload**. After the file is uploaded, it is imported into the keystore and its details are visible in the PGP Keys table. If a key with the same ID is imported again, the file is overwritten.
- 6. Click the **Download** icon of the key in the Encrypted Test Output column of the PGP Keys table to download and decrypt a test output file using the secret key of the imported public key. Successful decryption confirms the encryption is working for your keys.

Deleting a PGP Key

To delete an imported public key, click the **Delete** icon.

Configuring an FTP Delivery Channel Using PGP Keys

To create an FTP channel:

- 1. Navigate to the BI Publisher Administration page.
- 2. In the Delivery section, click the FTP link to open the FTP page.
- 3. Add a new FTP Server and click **Test Connection** to test it. The Filter Command field is read-only and is updated automatically when you select a PGP key.

- **4.** Select the PGP Key ID of the key you uploaded from the drop-down.
- **5.** Select the **true** check box for Sign Output to sign the encrypted document. If you select this check box, a -s parameter is added to the existing filter command.
- **6.** Test the connection again to confirm that an encrypted test file is sent to the remote directory. The FTP delivery channel can now be used in a scheduled job.

Subject Areas

Data Structure for Analytics: Explained

The business intelligence (BI) repository contains the metadata that defines which columns you can include in analyses, and the source of that data. The repository is organized into subject areas, which contain folders with the columns.

Note: You can also use the BI repository as a data source for reports.

Columns

This table describes the three types of columns available when you create or edit analyses..

Column Type	Description	Example	Icon for Column Type
Fact	Provides a measure of something, meaning that the values are numbers.	Total	Blue ruler
Attribute	Represents a piece of information about a business object, with values that are dates, IDs, or text.	Start Date	Blue column
	Note: Attribute columns can be flexfield segments imported into the BI repository.		
Hierarchy	Holds data values that are organized in a hierarchical manner.	Time, with sublevels: • Year • Quarter • Month	Tree structure of blue rectangles

Subject Areas

When you create an analysis, you first select a subject area, which contains columns related to a specific business object or area. You then open folders within the subject area to find the columns to include.

Folders

Each subject area has one fact folder and a number of dimension folders. Folders can have subfolders.

- Fact folders:
 - Contain fact columns.

o Are usually at the bottom of the list of folders and are usually named after the subject area.

Dimension folders:

- Contain attribute and hierarchical columns.
- Are joined to the fact folder within a subject area.
 For example, if your analysis has the Currency attribute from a dimension folder, you see currencies in the results. If you also add the Total fact, then your analysis includes only records with both a currency and a total amount. The more columns you add, the smaller the query set for your analysis.
- Can be common folders, or common dimensions, that appear in more than one subject area.
 If your analysis has columns from multiple subject areas, then you:
 - Should include columns only from dimension folders that are common to all of those subject areas. At least one such column is required.
 - Must include one column from the fact folder in each of those subject areas.

Procurement Subject Areas, Folders, and Attributes: Explained

To create real-time analyses, you should be familiar with the Oracle business intelligence concepts of subject areas, folders, and attributes.

Subject Areas

To create an analysis, you begin by selecting a subject area from which you select columns of information to include in the analysis. For example, to create an analysis of requisition information, you begin by selecting a Requisitions subject area. Subject areas are based around a business object or fact.

Procurement has a number of procurement specific subject areas:

- Procurement Implemented Change Orders Real Time
- Procurement Pending Change Orders Real Time
- Procurement Purchasing Agreements Real Time
- Procurement Purchasing Real Time
- · Procurement Requisitions Real Time
- Procurement Spend
- Sourcing Supplier Awards Real Time

- Sourcing Supplier Negotiations Real Time
- Sourcing Supplier Responses Real Time
- Supplier Supplier Real Time
- Supplier Import Supplier Real Time
- Supplier Registration Supplier Real Time
- Note: OTBI subject areas always have a suffix of Real Time.

Folders

Each subject area has one fact folder and a number of dimension folders. Fact folders contain attributes that can be measured, meaning that they are numeric values like order quantity and order amount. A special folder, called a Degenerate Dimension, is also associated with the fact folder. Each dimension folder is joined to the fact folder within a subject area.

Some folders appear in more than one subject area, such as Buyer, Procurement BU, and Requisitioning BU. These are referred to as common folders or common dimensions. Fact folders are usually at the bottom of the list of folders and are usually named after the subject area.

Each fact has a different level of granularity. For example:

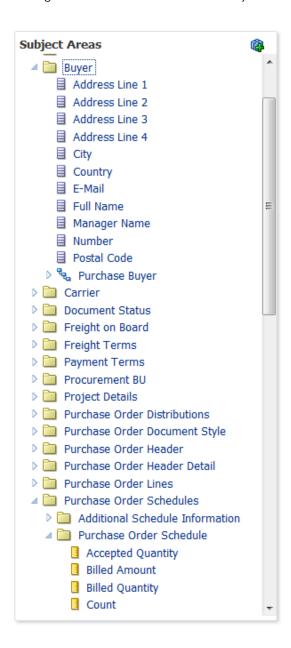

- Buyer has contact details
- Purchase Order Schedules has additional folders

Attributes

Finally, each dimension folder contains attributes, such as address, item details, and so on.

This figure illustrates the structure of subject areas, folders, and facts.

In the preceding figure, the following Transactional Business Intelligence components are shown:

- Subject area: Procurement Purchasing Real Time
- Dimension Presentation Folder: Buyer
- Dimension Attributes: Address Line, City, Country, Full Name. and so forth
- Fact Presentation Folder: Purchase Order Schedules

• Fact - Measures: Accepted Quantity, Billed Amount, Billed Quantity, Count

4 Flexfields

Configuring Flexfields for Use in Analyses: Overview

Flexfields are extensible sets of placeholder fields associated with business objects which can be placed on application pages. You can use flexfields to extend business objects and meet your data management requirements without changing the data model or performing any database programming. To include flexfields you have used for extension or customization for use in analyses, you must enable them for business intelligence.

Extension of analyses using flexfields is available for Oracle Enterprise Resource Planning Cloud and Oracle Human Capital Management Cloud. For Oracle Sales Cloud, the Extensibility Framework supports extension.

Flexfield Types

The following types of flexfields are available and provide a means to customize application features without programming:

- Descriptive
- Extensible
- Key

Depending on the flexfield type, business intelligence enablement is performed differently and has different requirements. Once they are enabled for business intelligence, you can import any changes made to flexfields automatically using an import scheduled process.

Configuring Key Flexfields for Transactional Business Intelligence

Enabling Key Flexfields for Business Intelligence Reporting: Procedure

To include flexfields in your Transactional Business Intelligence reporting, you must enable them for Business Intelligence. Extensibility of analysis using flexfields is used for Enterprise Resource Planning and Human Capital Management. For Customer Relationship Management, the Extensibility Framework supports this.

To designate key flexfields as BI-enabled:

- 1. Navigate to Manage Key Flexfields in Oracle Applications Cloud.
- 2. Enter your search value in Key Flexfield Code.
- 3. Click Manage Structure Instances.
- **4.** Enter your search value in Structure Instance Code.
- 5. Click Edit to display the Edit Key Flexfield Structure Instance dialog box.
- **6.** Select the **BI Enabled** option, then click **OK**.
- 7. For each flexfield segment instance, repeat steps 5 through 6.

- 8. Click Save.
- 9. Populate the BI Object Name for each of the segment labels:
 - a. Query the Key Flexfield Code in the Manage Key Flexfields window.
 - **b.** From the Actions menu, select **Manage Segment Labels**.
 - **c.** Populate the BI Object Name for each segment label to be mapped. The BI Object Name for the following qualified segment labels should not be modified:

Segment Label Code	Bl Object Name
FA_COST_CTR	Dim - Cost Center
GL_BALANCING	Dim - Balancing Segment
GL_ACCOUNT	Dim - Natural Account Segment

Before you deploy a flexfield, you must access the Chart of Accounts Instance and assign the newly created segment label to the appropriate segment in the Chart of Accounts.

- d. Click Deploy Flexfield.
- e. Click Save and Close.

Related Topics

• Enabling Key Flexfield Segments for Business Intelligence: Points to Consider

Supported Key Flexfields: Overview

Key flexfields are used to store internally defined codes unique to a particular business, specifying part numbers, general ledger accounts, and other business entities.

Product Area	Key Flexfield	Dimension
Fixed Assets	Category (CAT#)	Dim - Asset Category
Fixed Assets	Location (LOC#)	Dim - Asset Location
General Ledger	Accounting (GL#)	Dim - Balancing Segment
		Dim - Cost Center
		Dim - Natural Account
Payroll	Costing	Dim - Costing Segments
Supply Chain Management	Locator	Dim - Inventory Org
Supply Chain Management	Item Category	Dim - Item

Product Area	Key Flexfield	Dimension
Revenue Management	Pricing Dimensions (VRM)	Dim - VRM Segment
Budgetary Control	Budgeting (XCC)	Dim - XCC Segment

Mapping Non-Qualified Segments to BI Objects: Procedure

To map non-qualified segments that need to be mapped and used in analysis, create a new label and associate a BI object with the label. Associate this new segment label with the segment code.

To map non-qualified segments to BI objects:

- 1. From Manage Key Flexfields, search for the appropriate key flexfield code.
- 2. From the Actions menu, select Manage Segment Labels.
- 3. Click the Add Row icon.
- **4.** Enter the details for the Segment Label Code, including name, description, and BI Object name. Enter the BI object names carefully and note whether there is a space between **Segment** and the number. This table provides examples of Key Flexfields and associated BI object names.

Key Flexfield	Bl Object Name
Accounting (GL)	Dim - GL Segment1 through Dim - GL Segment10
Budgetary Control (XCC)	Dim - XCC Segment1 through Dim - XCC Segment10
Revenue Management (VRM)	Dim - VRM Segment 1 through Dim - VRM Segment 10

5. Complete the mapping by assigning unique segment labels to the key flexfields.

Setting Up the GL Accounting Flexfields: Procedure

This is the workflow for setting up Accounting key flexfields, but these steps also apply for other key flexfields.

- Understanding Accounting Key Flexfields
- Identifying Accounting Key Flexfields
- Assigning Unique Segment Labels
- Performing Column Flattening
- Designating GL Accounting Segment Instances as BI-Enabled
- Deploying Accounting Key Flexfields

Understanding Accounting Key Flexfields

The Accounting Key Flexfield is used to identify GL accounts.

A chart of accounts segment is a component of the accounting key flexfield. Each segment has a value set attached to it to provide formatting and validation of the set of values used with that segment. The combination of segments creates the

account combination used for recording and analyzing financial transactions. You must set up your Chart of Accounts (COA) as part of implementing Oracle Applications Cloud.

Examples of segments that may be found in a chart of accounts structure include Company, Cost Center, Department, Division, Region, Account, Product, Program, and Location.

The Natural Account segment of the General Ledger Accounting Key Flexfield defines the account used in the account combination to record transactions.

The logical segment dimensions in the Oracle BI metadata are pim - cost center, pim - Balancing segment, pim - Natural account segment and all pim - GL segmentndimensions. These dimension tables are populated from a Tree value object or from a Value Set value object depending on whether a tree was associated with the segment in the Oracle Applications Cloud setup:

 For each segment associated with trees, two value objects are generated (Tree and TreeCode) with the following naming structure:

FscmTopModelAM.AccountBIAM.FLEX_TREE_VS_segmentlabel_VI &

FscmTopModelAM.AccountBIAM.FLEX TREECODE VS segmentlabel VI

For each segment without trees, one view object are generated with the following naming structure:

FscmTopModelAM.AccountBIAM.FLEX VS XXX VI

In addition to the segment dimension tables, the BI Extension process also extends flex bi flattened vo; FscmTopModelam.AccountBiam.Flex_Bi_Account_vi. This view object has a pair of columns for each segment; segmentlabel_and segmentlabel_c.

For example, for your Cost Center segment which has the segment label FA_COST_CTR, there are two columns in this view object, named FA_COST_CTR_ and FA_COST_CTR_ c.

Identifying Accounting Key Flexfield Segments

Identify and map segments of the chart of accounts.

For each Chart of Accounts (Accounting Key Flexfield) used to analyze Transactional Business Intelligence facts, identify the segments of the chart of accounts and map them to the Transactional Business Intelligence GL Accounting Segment logical dimensions.

Accounting Key Flexfield Segment	Segment Label	Transactional Business Intelligence GL Accounting Segment Logical Dimension
Balancing	GL_BALANCING	Dim - Balancing Segment
Natural Account	GL_ACCOUNT	Dim - Natural Account Segment
Cost Center	FA_COST_CTR	Dim - Cost Center
Other segments to be equalized across the charts of accounts	Other unique segment label	Dim - GL Segment n where n is an integer from 1 to 10

Assigning Unique Segment Labels

You must assign a unique segment label to the charts of accounts segments that are the balancing segments or the natural account segments, and that are used for specific purposes.

For example, assign the Primary Balancing segment label to the segment used for your company or legal entities in order to provide a correct recording of intercompany transactions and company analysis. You can assign other segment labels when required.

To assign unique segment labels to charts of accounts segments:

- 1. Launch the Manage Charts of Accounts task and then navigate to the Manage Chart of Accounts page.
- 2. In the Search section, enter the GL# for the **Key Flexfield Code** and click the **Search** button.
- 3. In the Search Results section, select **Accounting Flexfield** and click the **Manage Structures** button to navigate to Manage Key Flexfield Structures.
- 4. In the Search section, enter the chart of accounts code or the name for Structure Code or Name and click the **Search** button.
- 5. In the Search Results section, select the chart of accounts and click **Edit** to navigate to the Edit Key Flexfield Structure window
- 6. Select the **Enabled** check box to code-enable the Structure code.
- 7. In the Segments section, select the applicable segments and click **Edit** to navigate to the Edit Key Flexfield Segment window.
- 8. Select the Enabled check box to enable the segments.
- **9.** In the Segment Labels section, select the unique segment labels to equalize the segments across the charts of accounts, and click the **right arrow** to move the segments to the selected list.
- 10. Click Save and Close to return to the Edit Key Flexfield Structure window.
- 11. Click **Done** to return to the Manage Key Flexfields window.

Performing Column Flattening

Column flattening of trees is required in order for OTBI hierarchy analyses to be populated with correct data.

To flatten columns for account hierarchies:

- 1. Launch Manage Trees and Tree Versions and navigate to the Manage Trees and Tree Versions window.
- In the Search section, enter GL_ACCT_FLEX for the Tree Structure Code and the involved tree code or name, and click Search.
- 3. In the Search Results section, select the tree version you want to flatten. If the status of the Tree Version is Draft, to make the Tree Version active, select **Actions**, then **Status**, and then **Active**.
- 4. (Optional): After the tree version is specified, perform an audit on the Tree Version to ensure its integrity before launching the flattening job. Select **Actions** and then **Audit**. See the section on working with Trees in the Developer's Guide.
- **5.** Choose **Column Flattening** from the **Actions** drop-down menu.
- **6.** Click the **Online Flattening** button to launch the flattening job immediately, or click the **Schedule Flattening** button to schedule the flattening job according to your requirements.

Designating GL Accounting Segment Instances as BI-Enabled

Specify the applicable chart of accounts segment instances that are BI-enabled to make them available for use in Transactional Business Intelligence.

To specify the chart of accounts segment instances as BI-enabled:

- 1. In the Search Results section of the Manage Key Flexfields window, select **Accounting Flexfield** and click the **Manage Structure Instances** button to navigate to the Manage Key Flexfield Structure Instances window.
- 2. In the Search section, select the chart of accounts for Structure Name and click the **Search** button.

- 3. In the Search Results section, select the structure instance and click **Edit** to navigate to the Edit Key Flexfield Structure Instance window.
- 4. Check the **Enabled** check box to code-enable the structure instance.
- 5. In the Segment Instances section, select the segment instances and click **Edit** to update. Each of the segment instances must be selected individually.
- Select the Business Intelligence enabled check box in the Edit Key Flexfield Segment pop-up window and click OK to return to Edit Key Flexfield Structure Instance window.
- 7. After you have enabled all applicable segment instances for Business Intelligence, click **Save and Close** to save the changes and return to the Edit Key Flexfield Structure Instance window.
- **8.** Repeat steps 2 6 for each chart of accounts to enable all the applicable segment instances for Business Intelligence.
- 9. Click **Done** to return to the Manage Key Flexfields window.
- 10. After you have configured all the charts of accounts, click the **Deploy Flexfield** button to deploy the Accounting Flexfield and make the latest definition available for use.

Deploying Accounting Key Flexfields

After you have set up accounting key flexfields, you must deploy them.

Accounting key flexfields have one of the following deployment statuses:

- Edited: The flexfield definition has not been deployed or changes have been made to the structure, the structure instances, or the value sets.
- Patched: The flexfield definition has been modified through an update, but the flexfield has not yet been deployed so the updated definition is not reflected.
- Deployed to Sandbox: The flexfield is deployed and available in a flexfield-enabled sandbox.
- Deployed: The flexfield definition is deployed and available to end users.
- · Error: The deployment attempt failed.

To deploy accounting key flexfields:

- 1. Access Manage Chart of Accounts from Setup and Maintenance work area.
- 2. Click Search.
- 3. Locate the Deployment Status column.
- 4. Click the icon under the heading.
- 5. Select Edited.
- 6. Click Deploy Flexfield.
- 7. Monitor the Deployment Status and when it reaches 100% click **OK**.
- 8. Verify that a green check mark displays in the Deployment Status column.
- 9. Click Done.

Configuring Descriptive Flexfields for Transactional Business Intelligence

Configuring Descriptive Flexfields for Transactional Business Intelligence: Overview

Configure descriptive flexfields to track unique information not typically found on business forms.

Descriptive flexfields can store several important details on a form without cluttering it. For example, several details may make an asset form heavy and unmanageable. However, the user still needs to access those details and therefore, they must be present on the form. In such cases, descriptive flexfields are convenient to use and are easy to manage.

Descriptive flexfields provide a way for you to add custom attributes to entities and to define validation and display properties for them. A descriptive flexfield is a logical grouping of attributes (segments) that are mapped to a set of extension columns which are shipped as part of Oracle Applications Cloud tables.

Configuring Descriptive Flexfield Segments: Procedure

If a descriptive flexfield is enabled for Oracle Business Intelligence, you can enable global and context segments for Oracle Business Intelligence, and you can select segment labels. Not all descriptive flexfields are supported for Business Intelligence.

Configuring a Descriptive Flexfield Segment

If a descriptive flexfield is enabled for Oracle Business Intelligence, you can enable global and context segments for Oracle Business Intelligence, and you can select segment labels. Not all descriptive flexfields are supported for Business Intelligence.

To configure available descriptive flexfield segments:

- 1. Navigate to the Setup and Maintenance window.
- 2. Navigate to the Manage Descriptive Flexfields window.
- 3. If the **BI Enabled** option is cleared, select it.
- 4. Select the options for deployment of the descriptive flexfields.

Setting Descriptive Flexfields as BI-Enabled: Procedure

If a descriptive flexfield is already defined, you can enable it for use in Business Intelligence reports. Not all descriptive flexfields are supported for Business Intelligence.

Setting a Flexfield as BI-Enabled

- 1. Navigate to **Setup and Maintenance** work area.
- 2. Navigate to the Edit Descriptive Flexfields window.
- 3. Enter the descriptive flexfield name.
- Check the BI Enabled option on the desired descriptive flexfields. If the option is unavailable, the flexfield is a non-supported entity.
- 5. Click OK.
- 6. Click Save.

Configuring Extensible Flexfields for Transactional Business Intelligence

Configuring Extensible Flexfields: Procedure

You can use extensible flexfields to configure more segments.

An extensible flexfield is similar to a descriptive flexfield in that it provides a customizable expansion space that you can use to configure additional attributes (segments) without additional programming. As with descriptive flexfields, each segment is represented in the database as a single column. However, with extensible flexfields, the context values and context-sensitive segments are stored in an extension table.

Categories and Contexts

You can combine and arrange the segments into attribute groups that are tailored to your specific needs. For example, you can group related segments so that they appear together on the page. The attribute groups are referred to as contexts. You can optionally set up an extensible flexfield to enable categorization of contexts.

You can add contexts and segments to extensible flexfields just like the descriptive flexfields. To see the extensible flexfields in analyses, you need to deploy them and then run the BI Extender Essbase scheduled process.

Configuring Extensible Flexfields

To configure extensible flexfields:

- 1. Open the Manage Extensible Flexfield task in the Setup and Maintenance work area.
- 2. Search for the EFF you want to configure, then select it and click the Edit icon.
- 3. In the Edit Extensible Flexfield dialog, highlight the category Display Name, then select Manage Contexts.
- 4. In the Manage Context dialog, search for the context that contains the segment you want to configure, highlight it, then click the **Edit** icon.
- 5. In the Edit Context dialog, click the Edit icon.
- 6. Edit the segment, as required, then click Save.

Related Topics

Flexfield Usages: Explained

Setting Extensible Flexfields as BI-Enabled: Procedure

Extensible flexfields are BI enabled if at least one segment in a context is BI enabled.

Setting Extensible Flexfields as BI-Enabled

To set extensible flexfields as BI-enabled:

1. Navigate to Setup and Maintenance.

- 2. Navigate to Manage Extensible Flexfields.
- 3. Enter the extensible flexfield name; for example, Organization Information EFF.
- 4. Select the applicable extensible flexfield, and then click Edit.
- 5. Select the applicable Category. The category contexts are populated automatically.
- 6. Click Manage Contexts
- 7. In the Edit Context page, select the applicable Context, and then click Edit.
- 8. Select the applicable Segment, and then click Edit.
- 9. In the Edit Segment page, select the BI Enabled check box at the bottom of the screen.
- 10. Click Save.

Essbase Rule File and Cubes: Overview

Generate the Essbase rule file by running the Create Rules XML File for BI Extender Automation scheduled process.

The Essbase rule file must be generated for all Oracle Essbase cubes mapped in the repository file (RPD).

Job Status Conditions

The process status displays one of these conditions.

- INIT: The process has just begun and is waiting for the extender command line JAR to update the status with more
 details.
- COMPLETED_NO_EXTENSION_NEEDED: No new Flex changes were detected in any of the Oracle Applications
 Cloud sources; because the RPD is already synchronized with all Flex changes, no changes were made in the RPD.
- COMPLETED: The RPD was successfully updated with Flex changes and uploaded into the Oracle Business Intelligence server.
- FAILED: Error conditions exist which require manual intervention.

Submitting Scheduled Processes and Process Sets: Procedure

Importing Changes to Flexfields Automatically

Importing Flexfield Changes: Overview

You can use the Import Oracle Fusion Data Extensions for Transactional Business Intelligence scheduled process to import your flexfield changes.

Use the Import Oracle Fusion Data Extensions for Transactional Business Intelligence scheduled process to automatically import the following types of changes:

- Key Flexfield changes
- Descriptive Flexfield changes
- Extensible Flexfield changes

The Import Oracle Fusion Data Extensions for Transactional Business Intelligence scheduled process imports extensible data, including data in descriptive flexfield segments, key flexfield segments, and General Ledger balances in Essbase cubes.

If you have changes to key flexfields and descriptive flexfields, you can import all the changes in the same scheduled process.

This is an Oracle Applications Cloud scheduled process; it is not related to BI Applications. Detailed information on this process can be found in Oracle Applications Cloud documentation.

Note: We strongly recommend that you backup the Oracle Business Intelligence Enterprise Edition prior to importing any flexfield changes. Running the process disconnects all users from the server. You should not run this process when maintenance operations or system updates are being performed on the server.

Running the Import Scheduled Process: Procedure

To import changes, run the Import Oracle Fusion Data Extensions for Transactional Business Intelligence scheduled process.

Running the Job

To run the process:

- 1. In the Scheduled Processes window, select Search and Select: Name.
- 2. Select Search and Select: Name.
- 3. Highlight Import Oracle Fusion Data Extensions for Transactional Business Intelligence.
- 4. Click OK.
- 5. Schedule the process.

Process Status Conditions

When the process is finished, the biExtenderCMDUtility.jar writes the status of the process into the JNDI file ess biExtenderEssJob jobStatus, which can be viewed in Oracle WebLogic Server.

The process status displays one of the following conditions:

- INIT: The process has just begun and is waiting for the extender command line JAR to update the status with more details.
- COMPLETED_NO_EXTENSION_NEEDED: No new Flex changes were detected in any of the Oracle Applications
 Cloud sources; because the Oracle Business Intelligence is already synchronized with all Flex changes, no changes
 were made in the Oracle Business Intelligence.
- COMPLETED: Oracle Business Intelligence was successfully updated with Flex changes and uploaded into the Oracle Business Intelligence Server.
- COMPLETED: PROCESS_ERRORS: Oracle Business Intelligence was updated with the Flex changes but with some warnings that require manual intervention.
- FAILED: Error conditions exist that require manual intervention.

Successful Import Process

If the import process is successful, you can perform the following actions:

- Query subject areas by segment dimensions such as Balancing Segment and Cost Center.
- Access DFF attributes for analyses.
- Use the General Ledger Balances Real Time subject area to query Oracle Essbase cubes.

Disabling Flexfields as BI-Enabled

Overview

If you created a flexfield that you no longer want to use or report against, you can disable the flexfield as BI-enabled.

There may be times, such as during development phases, when you try using a flexfield and later determine it is no longer needed.

Note: If you are considering disabling flexfields, keep in mind that any flexfields created in Oracle Applications Cloud must be designated as BI-enabled to be exposed in Transactional Business Intelligence. If you disable a flexfield, it cannot be deployed. Also, error conditions may occur if you disable a descriptive flexfield that has been implemented in BI Applications. If error conditions arise from disabling flexfields as BI-enabled, troubleshooting the errors can be difficult and time-consuming.

Disabling Key Flexfields as BI-Enabled: Procedure

If you created a flexfield that you no longer want to use or report against, you can disable the flexfield as BI-enabled.

If you are considering disabling key flexfields, keep in mind that any flexfields created in Oracle Applications Cloud must be designated as BI-enabled to be exposed in Transactional Business Intelligence.

Disabling Key Flexfields

To disable key flexfields as BI-enabled:

- 1. Navigate to Manage Key Flexfields .
- 2. Enter your search value in **Key Flexfield Code**.
- 3. Click Manage Structure Instances.
- **4.** Enter your search value in **Structure Instance Code**.
- 5. Click **Edit**. The Edit Key Flexfield Structure Instance dialog box displays.
- **6.** In **Edit Key Flexfield Segment Instance**, deselect the **BI Enabled** option.
- 7. Click **OK**, then **Save**.

Disabling Descriptive Flexfields as BI-Enabled: Procedure

If you created a flexfield that you no longer want to use or report against, you can disable the flexfield as BI-enabled.

If you are considering disabling descriptive flexfields, keep in mind that any flexfields created in Oracle Applications Cloud must be designated as BI-enabled to be exposed in Transactional Business Intelligence.

Disabling Descriptive Flexfields

To disable descriptive flexfields as BI-enabled:

1. Navigate to Setup and Maintenance.

- 2. Navigate to the Edit Descriptive Flexfields window.
- 3. Enter the **Descriptive Flexfield Name**.
- 4. Deselect the **BI Enabled** option on the desired descriptive flexfields.
- 5. Click **OK**, then **Save**.

Disabling Extensible Flexfields as BI-Enabled: Procedure

If you created a flexfield that you no longer want to use or report against, you can disable the flexfield as BI-enabled.

If you are considering disabling extensible flexfields, keep in mind that any flexfields created in Oracle Applications Cloud must be designated as BI-enabled to be exposed in Oracle Transactional Business Intelligence.

Disabling Extensible Flexfields

To disable extensible flexfields as BI-enabled:

- 1. Navigate to Setup and Maintenance, then Manage Extensible Flexfields.
- 2. Enter the extensible flexfield Name; for example, "Organization Information EFF."
- 3. Select the applicable extensible flexfield and click Edit to navigate to Edit Extensible Flexfield.
- 4. Select the applicable Category. The category contexts are populated automatically.
- 5. Click Manage Contexts to navigate to Manage Contexts.
- 6. Select the applicable Context and click **Edit** to navigate to Edit Context.
- 7. Select the applicable Segment and click **Edit** to navigate to Edit Segment.
- 8. Deselect the **BI Enabled** option displayed at the bottom of the screen.
- 9. Click Save.

Dimensions Supported by Descriptive Flexfields

Procurement Descriptive Flexfields for Business Intelligence

This table shows the Procurement product area dimensions supported by descriptive flexfields.

DFF Code	Dimension Name
PO_ATTRIBUTE_VALUES	Dim - Purchase Agreement Details
PO_ DISTRIBUTIONS	Dim - Purchase Order Details
PO_DOCUMENT_TYPES	Dim - Purchase Order Transaction Type
PO_HEADERS	Dim - Purchase Order Details
PO_ LINE_ LOCATIONS	Dim - Purchase Order Details
PO_LINE_TYPES	Dim - Purchase Line Type

DFF Code	Dimension Name
PO_LINES	Dim - Purchase Order Details
PO_NOTIFICATION_CONTROLS	Dim - Agreement Notification Controls
PON_ AUCTION_ HEADERS	Dim - Sourcing Negotiation Details
PON_ AUCTION_ ITEM_PRICES	Dim - Sourcing Negotiation Details
PON_ AUCTION_ SUPPLIER_ HEADERS	Dim - Sourcing Negotiation Details
POR_ REQ_ DISTRIBUTIONS	Dim - Purchase Requisition Details
POR_ REQUISITION_ HEADERS	Dim - Purchase Requisition Details
POR_ REQUISITION_ LINES	Dim - Purchase Requisition Details
POZ_ SUPPLIER_ SITES_ALL_M	Dim - Supplier Sites
POZ_SUPPLIERS	Dim - Supplier

5 Analytics Customization

Creating and Editing Analytics: Highlights

Edit and create custom analytics to provide ad hoc reporting on your transactional data. The predefined analyses and dashboards help answer many of your business questions, but you can also create your own to meet custom requirements.

This table gives a just a few examples of creating or editing analytics.

Task	Example
Create an analysis	Your team needs a simple list of all your accounts, sorted by account ID. You include the account name, ID, and address in a new analysis, and add sorting on the ID column.
Create a view	A predefined analysis has a bar graph. You save a custom version of this analysis with a table view and add it below the graph.
Create a view selector	You later decide that you want to toggle between viewing a table and a graph. You add a view selector that includes the table and graph views.
Edit a dashboard prompt	A predefined dashboard has a Start Date prompt. You make a copy of the dashboard and replace Start Date with a date range prompt.
Create a dashboard	You create a dashboard that includes an analysis and a report to view both together.

Tip: A wizard in the Reports and Analytics pane is available to help you create or edit analyses.

Data Source Customization

Administrators can customize the business intelligence (BI) repository to determine the columns available for you to use.

- They enable flexfields (which support custom attributes) for BI, and import them into the repository.
- You can then select attributes from flexfields to include in your analyses.

Analyses

Creating and Editing Analyses Using a Wizard: Procedure

You can use a wizard that guides you through creating and editing analyses. Even though the wizard doesn't give you all available features, you can still use it to make typical changes, for example adding views or filters. For other tasks, such as creating dashboards or deleting analyses, use the advanced business intelligence features.

Creating an Analysis

- 1. Open the Reports and Analytics work area, or the Reports and Analytics pane if available in other work areas.
- 2. Click Create and select Analysis.
- 3. Select the subject area that has the columns you want for your analysis.
- 4. Optionally, add more subject areas or remove any that you no longer need.
- 5. Select the columns to include, set options for each column, and click Next.
- 6. Optionally, enter a title to appear at the top of the analysis, above the analysis name that you enter in the last step.
- 7. Select the type of table or graph to include, specify the layout of the views, and click **Next**.
 - Note: At any point after this step, you can click Finish to go to the last step, to save your analysis.
- 8. Optionally, set more options for the table or graph, and click **Next**.
- 9. Optionally, add sorts or filters based on any of the columns you included, and click Next.
- **10.** If you have a table, optionally define conditional formatting for select columns, for example to display amounts over a certain threshold in red. Click **Next**.
- 11. Enter the name of your analysis and select a folder to save it in.
- 12. Click Submit.

Editing an Analysis

- 1. Open the Reports and Analytics work area, or the Reports and Analytics if available in other work areas where you can find the analysis.
- 2. Select your analysis in the pane and click **Edit**.
- 3. Perform steps 4 through 10 from the preceding Creating an Analysis task, as needed.
- **4.** To update an existing analysis, select the same name in the same folder. To save this analysis as a new copy, either name it with a new name or save it in a new folder.
- Click Submit.

Creating and Editing Analyses with Advanced Features: Procedure

Even though you can use a wizard to create or edit analyses, you might have to use advanced features for complicated analyses or specific requirements. For example, you can create view selectors so that users can toggle between views within an analysis, or define criteria for filters using SQL statements.

You can also perform other actions on analyses, for example delete them or copy and paste them within the business intelligence catalog.

Creating or Editing an Analysis

- 1. Open the Reports and Analytics work area, or the Reports and Analytics pane if available in other work areas.
- 2. Click the Browse Catalog button.
- 3. Click the New button, select Analysis under Analysis and Interactive Reporting, and select a subject area.

Or, select your analysis in the Folders pane and click Edit.

4. Use the tabs as described in this table.

Tab	Task
Criteria	Select and define the columns to include.
	Add filters.
Results	Add views and set options for results.
Prompts	Define prompts to filter all views in the analysis.
Advanced	View or update the XML code and logical SQL statement that the analysis generates.
	Set options related to query performance.

5. Save your analysis.

Performing Other Actions on an Analysis

- 1. Open the Reports and Analytics work area, or the Reports and Analytics pane if available in other work areas where you can find the analysis.
- 2. Select your analysis in the pane and click More.
- 3. Click More for your analysis and select the desired action, for example Delete or Copy.

Dashboards

Creating and Editing Dashboards: Procedure

You can create and edit dashboards to determine their content and layout. In addition to objects in the business intelligence (BI) catalog, such as analyses, reports, and prompts, you can add text, sections, and more to a dashboard.

Creating a Dashboard

- 1. Open the Reports and Analytics work area, or the Reports and Analytics pane if available in other work areas.
- 2. Click Browse Catalog.
- 3. Click New and select Dashboard under Analysis and Interactive Reporting.
- 4. Enter the dashboard's name and description, and select a folder to save in.
- 5. With the Add content now option selected, click OK.
- 6. Optionally, add more pages, or tabs, within the dashboard.
- 7. Drag and drop items from the Dashboard Objects or Catalog pane to add content to a page.
- 8. Click Save.
- Note: The first dashboard page is saved with the page 1 name by default. To rename this page:
 - 1. Click the Catalog link.
 - 2. In the Folders pane, select your dashboard.
 - 3. For page 1, click More and select Rename.
 - 4. Enter the new name and click **OK**.

Editing a Dashboard

- 1. Open the Reports and Analytics work area, or the Reports and Analytics pane if available in other work areas where you can find the dashboard.
- 2. Select your dashboard in the pane and click **More**.
- Click Edit.
- **4.** Perform steps 5 and 6 from the preceding Creating Dashboards task, and make other changes as needed, for example:
 - Remove content from the dashboard.
 - Drag and drop within a page to move content around.
 - Change the layout of a page.

Copying a Purchasing Dashboard: Worked Example

This example demonstrates how to copy a predefined business intelligence dashboard so that you can customize the copy and not the original.

The following table summarizes key decisions for this scenario.

Decisions to Consider	In This Example
Which predefined dashboard are you copying?	Amount Released From an Agreement Lines by Requisitioning BU on the Released Purchase Order
Is the copied version for yourself only or to be shared among multiple users?	Shared

Make a copy of the Amount Released From an Agreement Lines by Requisitioning BU on the Released Purchase Order dashboard and all its contents, including its analysis and prompt, and place them in the appropriate folders under **Shared Folders - Custom**. Edit the copied dashboard so that it contains the copied analysis and prompt.

Copying the Dashboard

- Navigate to the Reports and Analytics work area (Navigator Tools Reports and Analytics).
- 2. Go to Shared Folders Procurement Purchasing Amount Released From an Agreement Lines by Requisitioning BU on the Released Purchase Order page 1, and click the More link.
- 3. In the Folders pane, select the Amount Released From an Agreement Lines by Requisitioning BU on the Released Purchase Order dashboard folder.
- 4. Click the **Copy** icon in the toolbar.
- 5. In the Folders pane, go to **Shared Folders Custom Procurement**.
- 6. In the toolbar, click the New icon and select Folder.
- 7. Enter Purchasing in the Name field and click the OK button.
- 8. Click the Paste icon in the toolbar to create a copy of the dashboard selected earlier.

Copying the Prompt and Analysis

- 1. With the Purchasing folder still open, in the toolbar of the Folders pane, click the **New** icon and select **Folder**.
- 2. Enter **Prompts** in the **Name** field and click the **OK** button.
- 3. Create another folder with the name **Report Components**.
- 4. In the Folders pane, go to **Shared Folders Procurement Purchasing**, and select the Prompts folder.
- 5. For the Amount Released From an Agreement Lines by Requisitioning BU on the Released Purchase Order dashboard prompt, click the **More** link and select **Copy**.
- In the Folders pane, select Shared Folders Custom Procurement Purchasing Prompts, and click the Paste icon in the toolbar.
- 7. In the Folders pane, go to **Shared Folders Procurement Purchasing**, and select the Report Components folder.
- **8.** For the Amount Released From an Agreement Lines by Requisitioning BU on the Released Purchase Order analysis, click the **More** link and select **Copy**.
- 9. In the Folders pane, select **Shared Folders Custom Procurement Purchasing Report Components**, and click the **Paste** icon in the toolbar.

Editing the Copied Dashboard

- 1. In the Folders pane, go to Shared Folders Custom Procurement Purchasing Amount Released From an Agreement Lines by Requisitioning BU on the Released Purchase Order.
- 2. Select the copied dashboard that you wish to customize and click the Edit link.
- 3. The Catalog page opens with your dashboard. Click the Edit link for your dashboard.
- 4. If you make changes, click the **Save** icon, otherwise just close the page to return to the Reports and Analytics page.

Adding a Purchasing Analysis to the Welcome Dashboard: Worked Example

This example shows how to add an analysis to the Welcome dashboard. This dashboard is a page in the application, not a dashboard in the business intelligence (BI) catalog.

You can add analyses to any desktop page that you're able to personalize. The analysis will show up on that page only for you, not anyone else.

The following table summarizes key decisions for this scenario.

Decisions to Consider	In This Example
Which analysis do you want to add?	Top 10 Suppliers by Open Purchase Order Count and Buyer
	Ensure that the analysis isn't querying against a large volume of records. If it is, then the dashboard can take a long time to open after you add the analysis.
Do you want to change the layout of the page?	Yes, to a two-column layout that is wider on the right side.
	The one- or two-column layout gives enough space to properly display analyses.
Do you want all or only one view of the analysis?	All views.

Steps

- 1. Navigate to the Welcome dashboard.
- 2. Click your name in the global area and select **Edit Current Page**.
- 3. Click Change Layout and select Two columns, narrow left.
- 4. Click Add Content for the narrow column.

The **Reports and Analytics** folder in the Add Content dialog box contains what's in the Bl catalog.

- Click through the folders in the catalog until you see the name of the desired analysis. Start with Reports and Analytics.
- 6. Click BIPresentationServer.
- Click Shared Folders.
- 8. Click Procurement.
- 9. Click Purchasing.
- 10. Click Transactional Analysis Samples.
- 11. Scroll down to "Top 10 Suppliers by Open Purchase Order Count and Buyer" and click Add to include all views of the analysis.

If you instead click **Open** or **Top 10 Suppliers by Open Purchase Order Count and Buyer**, you can select a specific view to add.

- 12. Click Close after you see the analysis added to the top of the column on the dashboard.
- 13. Click Save and then Close.

6 Reports Customization

Creating and Editing Reports: Explained

Use reports to generate and print documents for internal operations, external business transactions, or legal requirements. To meet specific requirements, you may need to create or edit reports to capture different data, or present data in another way.

Report Components

Each report has components that you can customize, as described in this table:

Report Component	Description	Tool for Customizing
Data model	Defines the data source, data structure, and parameters for the report. Multiple reports can use the same data model. Each report has one data model.	Data model editor in the application
Layout	Defines the presentation, formatting, and visualizations of the data. A report can have multiple layouts. There are different types of layout templates, for example Excel and RTF.	Depending on the template file type: • XPT: Layout editor in the application • RTF: Microsoft Word • PDF: Adobe Acrobat Professional • Excel: Microsoft Excel • eText: Microsoft Word
Properties	Specifies formatting and other settings for the report.	Report editor in the application

What You Can Create or Edit

This table gives just a few examples of creating or editing reports.

Task	Example
Edit the layout of a report.	Add your company logo to the report output.
Add a new layout to a report.	Design a new layout template that provides less detail than the existing template.
Edit a data model.	Add two fields to the data model used by a report so you can add those new fields to a custom layout for the report.
Create a new report based on a new data model.	Create a new data model based on data from an external system, and create reports using the custom data model.

Accessing Report Components to Customize: Points to Consider

To create or edit reports, you must access the business intelligence (BI) catalog. In the catalog, objects of type Report represent the report definition, which includes report properties and layouts. Data models are separate objects in the catalog, usually stored in subfolders called Data Models.

Accessing the BI Catalog

You can access the BI catalog in any of the following ways:

- In the Reports and Analytics pane, click **Browse Catalog** to open the BI catalog, and find your report or data model in the Folders pane.
- In the Reports and Analytics pane, find your report and select **More** to go to the report directly in the catalog. The data model associated with the report should be in the Data Models subfolder within the same folder as the report.
- Sign in to the application directly (for example: http://host:port/analytics/saw.dll) to open the catalog.
- Sign in to the BI server directly (for example: http://hostname.com:7001/xmlpserver) to open the catalog.
 - o Alternatively, once you are in the catalog using another method, for example, through the Reports and Analytics pane, change the final node of the URL. For example, change (http://host:port/analytics/saw.dll) to xmlpserver. So the URL you use would be: http://host:port/xmlpserver.

Predefined Reports

A special Customize option is available only:

- For predefined reports, not data models.
- Through direct access to the BI server using the /xmlpserver URL. When you find your report in the BI catalog, select Customize from the More menu.

The Customize option automatically creates a custom copy of a predefined report and stores it in the **Shared Folders - Custom** folder within the catalog. The new report is linked to the original, so that when users open or schedule the original, they are actually using the custom version.

If you don't have access to the Customize option or don't want the original version linked to the new report, then make a copy of the predefined report and save it in the Custom folder.

Predefined Data Models

Don't edit predefined data models. Instead, copy the data model into the Custom folder and edit the copy.

Related Topics

- Saving Analytics and Reports: Points to Consider
- What happens to customized analytics and reports when a patch is applied?

Using the Customize Option for Predefined Reports: Points to Consider

The Customize option automatically creates a custom copy of a predefined report and stores it in the **Shared Folders - Custom** within the business intelligence (BI) catalog. The custom copy includes the report definition, folder structure, and original report permissions, and is linked internally to the original report. You can edit the custom copy of the report, leaving the original report intact. When users open or schedule the original report, they are actually using the custom version.

Benefits of the Customize Option

In addition to conveniently copying a predefined report to the Custom folder, the Customize option:

- Makes it unnecessary to update processes or applications that invoke the report. For example, if the original report is set up to run as a scheduled process, you don't need to change the setup. When users submit the same scheduled process, the custom report runs instead of the original.
- Automatically copies the security settings of the original report.
- Removes the risk of patches overwriting your edits. If a patch updates the original report, the custom report is not updated in any way.
 - Note: The custom report still references the original data model. The data model is not copied. A patch that updates the data structure of the data model might affect your custom report.

Accessing the Customize Option

To access the Customize option:

- 1. Sign in to the BI server (for example, http://hostname.com:7001/xmlpserver).
- 2. In the Folders pane, select the predefined report.
- 3. Select **Customize** from the **More** menu for the report.
- 4. The copied report in the Custom folder opens, so proceed to edit this report.

To edit the custom report again later, you don't need to be in the BI server. Just go to the BI catalog and either:

- Select the Customize or Edit option for the original report.
- Find your custom report in the Custom folder and select Edit.

Links Between Original and Custom Reports: Points to Consider

The Customize option for predefined reports creates a custom copy of the report that is linked to the original. Consider the following points when you work with both the original and custom versions.

Maintaining the Link Between Reports

The link between the predefined and custom report is based on the name of the custom report and its location within the Custom folder in the business intelligence (BI) catalog.

- If you manually create a report with the same name as a predefined report, and give it the same folder path under the Custom folder, then the new report becomes a custom version of the original. It would be as if you had used the Customize option to create the custom report.
- You can edit the custom report so that it uses a different data model. But if the original data model is updated later, then your custom report doesn't benefit from the change.
- 1 Important: The link to the original report breaks if you rename the custom or original report.

Tasks Performed on Original Reports

This table describes what happens when you use the original report and a corresponding custom report exists.

Task Performed on the Original Report	Result When There's a Custom Report
Open	Opens the custom report.
Schedule	Creates a report submission for the custom report.
Edit	Edits the custom report.
Delete	Deletes the original report only. If you delete the custom report, the original report is not deleted.
Сору	Copies the original report.
Cut and Paste	Cuts and pastes the original report.
Rename	Renames the original report. The custom report name is not changed.
	Caution: This breaks the link between the original and custom reports.
Download	Downloads the custom report.
Customize	Edits the custom report.

Task Performed on the Original Report	Result When There's a Custom Report
History	Opens the job history of the custom report.

Layouts

Creating and Editing Report Layouts: Overview

The layout determines what and how data is displayed on report output. Each report has at least one layout template. This topic describes the following aspects of report templates:

- · Layout templates
- Layout template types
- Overall process of managing layouts
- Deleting layout templates

Layout Templates

To customize a layout, you edit the layout template, which:

- Defines the presentation components, such as tables and labeled fields.
- Maps columns from the data model to these components so that the data is displayed in the right place.
- Defines font sizes, styles, borders, shading, and other formatting, including images such as a company logo.

Layout Template Types

There are a few types of template files to support different report layout requirements.

- RTF: Rich text format (RTF) templates created using Microsoft Word.
- **XPT:** Created using the application's layout editor, these templates are for interactive and more visually appealing layouts.
- eText: These templates are specifically for Electronic Data Interchange (EDI) and electronic funds transfer (EFT) information.

You can also create and edit other types of templates using Adobe PDF, Microsoft Excel, Adobe Flash, and XSL-FO.

Overall Process to Create or Edit Layouts

Editing or creating report layout, for example using Microsoft Word or the layout editor, involves making the actual changes to the template file. But that task is just one part of the entire process for customizing layouts.

- 1. Copy the original report and save the custom version in **Shared Folders Custom** in the business intelligence (BI) catalog. You create or edit templates for the custom copy of the report.
 - Tip: You can use the Customize option if the original is a predefined report.
- 2. Review report settings for online viewing.
- 3. Generate sample data for the report.
- **4.** Edit or create the layout template file.
- 5. Upload the template file to the report definition. Skip this step if you're using the layout editor.
- **6.** Configure the layout settings.

Deleting Layout Templates

To remove a layout template for a report:

- 1. Select your report in the BI catalog and click **Edit**.
- 2. In the report editor, click View a list.
- 3. Select the layout template and click **Delete**.

Making Reports Available for Online Viewing: Procedure

Some reports are set up so that you can only view them through another application or submit them as scheduled processes. To view your report online while you're editing it, you must define a few settings. When you're done editing your report, make sure that you reset these settings as needed.

Updating Report Properties

- 1. Select your report in the business intelligence catalog and click **Edit**.
- 2. In the report editor, click **Properties** at the top of the page.
- 3. In the Report Properties dialog box, select Run Report Online and deselect Report is Controlled by External Application.

Updating Layout Settings

- 1. Back in the report editor, click View a list.
- 2. Make sure that the View Online check box is selected.

Generating Sample Report Data: Procedure

Depending on the type of report layout changes you're making, sample data can be required or optional. You generate sample data, and then load it for use with your layout so that you can map data fields to layout components. For example, for the Start Date table column in your layout, you can set it so that the data displayed in that column comes from the Start Date field in the sample data.

You can generate sample data from the:

- Report data model
- Report viewer
- Scheduler

Generating Sample Data from the Data Model

Follow these steps:

- 1. Select your data model in the business intelligence (BI) catalog and click Edit.
 - Tip: If you're not sure which data model is the source for your report, find the report in the catalog and click **Edit**. The data model is displayed in the upper left corner of the report editor.
- 2. In the data model editor, click View Data.
- 3. Enter values for any required parameters, select the number of rows to return, and click View.
- **4.** To save the sample data to the data model, click **Save As Sample Data**. If you're designing an RTF template, click **Export** to save the file locally.
- 5. Save the data model.

Saving Sample Data from the Report Viewer

For reports that are enabled for online viewing, you can save sample data from the report viewer:

- 1. Select the report in the BI catalog.
- 2. Click **Open** to run the report in the report viewer with the default parameters.
- 3. On the Actions menu, click Export, then click Data.
- 4. Save the data file.

Saving Sample Data from the Scheduler

For reports that are enabled for scheduling (not necessarily as a scheduled process), you can save sample data from the scheduler:

- 1. Select the report in the BI catalog.
- 2. Click Schedule.
- 3. On the General tab, enter values for any report parameters.
- 4. On the Output tab, ensure that **Save Data for Republishing** is selected.
- 5. Click Submit.
- 6. Open the Report Job History page.
- 7. On the global header, click **Open**, then click **Report Job History**.
- 8. Select your report job name in the Job Histories table.
- 9. On the details page, under Output and Delivery, click the XML Data Download icon button.

Layout Templates

Creating and Editing Report Layout Templates Using the Layout Editor: Procedure

The layout editor in the application provides an intuitive, drag-and-drop interface for creating pixel-perfect reports with PDF, RTF, Excel, PowerPoint, and HTML output. The layout template files you create with this tool have an .xpt extension. The

layout editor tool is the only editing tool that provides dynamic HTML output. Users can interact with this output in a browser, for example by sorting, applying filters, and so on.

Prerequisite

Make sure that sample data is generated from the data model that your report is using.

Using the Layout Editor

To customize XPT templates:

- 1. Select the report in the business intelligence (BI) catalog and click Edit.
- 2. In the report editor, click **Edit** to update a template.
 - Or, click Add New Layout and select a template type under the Create Layout section.
- 3. Create or edit the layout.
- 4. Click **Save** to save the layout to the report definition.

Setting Up for RTF and Excel Report Layout Templates: Procedure

You can use Microsoft Word or Microsoft Excel to create or edit RTF and Excel layout templates, in addition to the layout editor in the application. If you use Word or Excel directly, you must download and install the appropriate add-in so that the Microsoft application has the features you need to design report layouts.

Note: If you're designing a new layout for your report, consider using the layout editor instead unless you are an experienced layout designer.

Installing the Add-In

- 1. Open the Reports and Analytics work area, or the Reports and Analytics pane if available in other work areas.
- 2. Click the **Browse Catalog** button.
- 3. Click Home.
- 4. Under the Get Started pane, click **Download BI Desktop Tools**.
- 5. Select the add-in for the type of template you're working with.
 - Template Builder for Word: RTF templates
 - Analyzer for Excel: Excel templates
- 6. Save and then run the installer.

Creating and Editing RTF Report Layout Templates: Procedure

An RTF template is a rich text format file that contains the layout instructions to use when generating the report output. Use Microsoft Word with the Template Builder for Word add-in to design RTF templates.

Prerequisites

Install the Template Builder for Word add-in, and generate sample data.

Using Template Builder for Word

To customize an RTF template:

- 1. If you are editing an existing layout:
 - a. Select your report in the business intelligence catalog and click Edit.
 - **b.** In the report editor, click the **Edit** link of the layout to download the RTF file.

If you are creating a new layout, skip this step.

- 2. Open the downloaded RTF template file in Microsoft Word. Or, if you're creating a new template, just open Microsoft Word.
- 3. Load the sample data that you generated.
- 4. Edit or create the layout template.
- 5. Save the file as Rich Text Format (RTF).

eText Report Layout Templates: Explained

An eText template is an RTF-based report template that is used for Electronic Funds Transfer (EFT) and Electronic Data Interchange (EDI). The template is applied to an input XML data file to create a flat text file that you transmit to a bank or other organizations. Use Microsoft Word to create or edit eText templates.

File Format

Because the output is for electronic communication, not printing, you must follow specific format instructions for exact placement of data on the template. You design eText templates using tables.

- Each record is represented by a table.
- Each row in a table corresponds to a field in a record.
- The columns of the table specify the position, length, and value of the field.

Special Commands

You might need to set up special handling of the data from the input XML file. This table describes the two levels of handling and where you declare the corresponding commands.

Level	Example	Setup
Global	Character replacement	Declare global commands in separate setup tables.
	Sequencing	laules.
Record	Sorting	Declare functions in command rows, in the same table as the data.

Uploading the Layout Template File to the Report Definition: Procedure

If you're creating or editing a report layout using the layout editor, the layout is automatically saved to the report definition, so you can skip this step. For all other layout types, for example RTF, upload the template file to the report definition after you're done making layout changes.

Uploading the Template File

- 1. Select your report in the business intelligence catalog and click **Edit**.
- 2. In the report editor, click View a list.
- 3. In the table that lists the layouts, click **Create**.
- 4. Under Upload or Generate Layout, click Upload.

- 5. In the Upload Template File dialog box:
 - a. Enter a layout name.
 - **b.** Browse for and select the layout template file that you created or edited.
 - **c.** Select the template file type.
 - d. Select the locale, which you can't change once the template file is saved to the report definition.
 - e. Click Upload.
- 6. Save the report definition.

Configuring Layout Settings for Reports: Procedure

As part of creating or editing layout, you can set report properties related to layout. These settings determine, for example, which layouts users can choose from when viewing or scheduling the report. The settings apply only to your report.

Setting Layout Properties

- 1. Select your report in the business intelligence catalog and click **Edit**.
- 2. In the report editor, click View a list.
- 3. Set layout properties, some of which are described in this table.

Setting	Usage
Output Formats	Depending on the requirements for a report, you may want to limit the output file formats (for example PDF or HTML) that users can choose from. The available output formats vary depending on the template file type.
Default Format	When multiple output formats are available for the report, the default output format is generated by default when users open the report in the report viewer.
Default Layout	When multiple layouts are available for the report, you must select a default layout to present it first in the report viewer.
Active	Active layouts are available for users to choose from when they view or schedule the report.
View Online	Select this check box so that layouts are available to users when they view the report. Otherwise, the layout is available only for scheduling the report.

4. Click Save Report.

Data Models

Customizing Data Models: Procedure

A data model defines where data for a report comes from and how that data is retrieved. If a data model can't give you all the data that you need in your report, then you can either copy and edit an existing data model or create a new one.

Creating a Data Model

- 1. In the business intelligence (BI) catalog, click the **New** button and select **Data Model** under **Published Reporting**.
- 2. Optionally click the **Data Model** node in the Data Model pane to set properties for the data model.
- 3. Click the **Data Set** node in the Data Model pane to create or edit data sets, which determine where and how to retrieve data.
- 4. Click the New Data Set button and select a data set type. It's best practice to use the BI repository as a data source, so you should select either:
 - Oracle BI Analysis: To use columns from a selected analysis.
 - SQL Query: To use a Query Builder tool to define what to use from the repository. Select Oracle BI EE as
 the data source.
- 5. Optionally, to limit the data included in the report output, click the **Parameters** node in the Data Model pane to define variables that users can set when they use the report.
 - Note: The order of parameters is important if there are job definitions defined for reports that use your data model. If you change the order in the data model, you must also update the job definitions.
- **6.** Optionally, define other components of the data model.
- 7. Save your data model.

Editing a Data Model

- 1. To edit a predefined data model:
 - a. Find the data model in the BI catalog and click Copy.
 - **b.** Paste within **Shared Folders Custom** in a subfolder that has a folder path similar to the folder that stores the original data model.
 - c. For the data model you pasted, click More, and select Edit.
- 2. Optionally click the **Data Model** node in the Data Model pane to set properties for the data model.
- 3. Click the Data Set node in the Data Model pane to create or edit data sets.
 Most predefined data models are of type SQL Query, and are set up to get application data from the following tables:
 - ApplicationDB_FSCM: Financials, Supply Chain Management, Project Management, Procurement, and Incentive Compensation
 - ApplicationDB_CRM: Sales
 - ApplicationDB_HCM: Human Capital Management
- 4. Perform steps 5 through 7 from the preceding Creating a Data Model task, as needed.

Related Topics

- Data Structure for Analytics: Explained

New Reports

Creating Custom Reports: Procedure

Create a custom report when the predefined reports don't provide the data you need. Or, if you want to use a predefined data model, and also want to change other aspects of the report other than layout. Save your custom report to **Shared Folders - Custom** in the business intelligence catalog.

Creating a Report

- 1. Open the Reports and Analytics work area, or the Reports and Analytics pane if available in other work areas.
- 2. Click Create and select Report.
- 3. Select the data model to use as the data source for your report.
- 4. Continue with the wizard to create the report layout, or choose to use the layout editor and close the wizard.
- 5. Define the layout for the report.
- Click the **Properties** button in the report editor to set specific formatting, caching, and processing options for your report.

Setting Up Access

You or your administrator can:

- Create a job definition so that users can run your custom report as a scheduled process.
- Set up the report for scheduling in the Reports and Analytics pane.
- Secure general access to your report and its job definition, if any.

- Setting Reports Up for Scheduling in the Reports and Analytics Pane: Procedure

7 Analytics and Reports Management

Managing Folders

Creating Folders: Procedure

You manage analyses and reports in the business intelligence catalog, where you create folders to organize them.

Creating Folders

Follow these steps:

- 1. In the catalog, navigate to the desired location of the new folder in the Folders pane.
- 2. In the catalog toolbar, click **New**, and select **Folder**.
- 3. In the New Folder dialog box, enter the folder name, and click **OK**.

Addressing Automatically Created Folders

If conflicts are detected during upgrade, folders named backup_nnn are automatically created in the catalog. After reviewing and resolving any conflicts, Oracle recommends that you manually delete the backup folders from the catalog. You can contact your help desk to request an automated removal if you have a large number of folders to delete.

Setting Folder Permissions and Attributes: Procedure

Business intelligence catalog folder properties control folder permissions and other attributes. You can access the properties of any object or folder in the catalog to perform tasks such as viewing system information or changing attributes or ownership. All other users can only access and modify the properties of the objects that they create or own.

Setting Folder Properties

Follow these steps:

- 1. In the catalog, select the folder you want to assign properties to.
- 2. In the Tasks pane, click Properties.
- **3.** In the Properties dialog box, select any of the options in the Attributes section:
 - Hidden: Specifies that the object is hidden.
 - System: Specifies that the object is a system object.
 - Read Only: Specifies that the object is read-only.
 - Do Not Index: Excludes the object from the index used by the full-text catalog search. Excluded objects do
 not display in the results of any full-text catalog search; the object can still be found using the basic catalog
 search.

- **4.** Use the Ownership section to take ownership of a folder or object in the catalog. This area displays only if the proper privileges were assigned to the user, group, or role. Note that the owner of an object or folder can't automatically access the object or folder.
 - Set ownership of this item: Click to become the owner of the folder or object.
 - Set ownership of this item and all sub items: Click to become the owner of the folder and any sub folders or sub items contained within the item. For example, if you click this link for a dashboard folder, then you take ownership of all of the dashboard's components.

Setting Folder Permissions: Procedure

You can assign permissions on folders and other objects.

Accessing and Setting Permissions

You can set permissions or change ownership for any catalog object or folder. Nonadministrative users can access and modify the permissions of the objects that they create or own.

To set folder permissions:

- 1. In the catalog, select the folder or object.
- 2. In the Tasks pane click **Permissions**.
- 3. In the Permissions dialog box, the owner and any other users, roles, or groups with permissions are listed in the Permissions list. To add a user or role, click **Add users/roles** in the toolbar and search for users or roles to add them to the Selected Members list in the Add Application Roles, Catalog Groups and Users dialog box. To delete a user or role, select the account or role in the Permissions list and click Delete selected users/roles.
- **4.** In the Permissions list, to set ownership for a user, select Custom in the Permissions drop-down list for the account, then select **Set Ownership** in the Custom Permissions dialog box and click **OK**. You can also select the Owner option for the user or role.
- 5. Use the Permissions drop-down to set permissions for the object. Object permissions vary by object.
- **6.** Use the Apply permissions to sub-folders option to assign permissions to the folder's subfolders, and the Apply permissions to items within a folder to assign them to objects in the folder but not to subfolders.

Using Briefing Books

Creating Briefing Books: Procedure

A briefing book is a collection of updatable or static analyses or dashboard pages (which can contain reports). The static snapshots give you a picture of what's going on at the time that the analysis or dashboard page is added to the briefing book. You can download briefing books as PDF or MHTML for viewing or printing, and share them with others. The PDF file includes a table of contents for the book. Like analytics and reports, briefing books are stored in the business intelligence (BI) catalog.

Adding Content to New Briefing Books

Follow these steps:

- 1. Open the Reports and Analytics work area, or the Reports and Analytics pane if available in other work areas.
- 2. Click the **Browse Catalog** button.
- 3. Select your analysis, then click **More** and select **Add to Briefing Book**.

Or, find your dashboard and click Open.

- a. Go to the dashboard page you want to add.
- b. Click the Page Options button and select Add to Briefing Book.
- Indicate if you want the analysis or dashboard results to change (Updatable) or not (Snapshot) whenever the briefing book is downloaded or rerun.
- 5. Click Browse.
- 6. Name your briefing book and save it in My Folders.

Adding Content to Existing Briefing Books

Follow these steps:

- 1. Open the Reports and Analytics work area, or the Reports and Analytics pane if available in other work areas.
- 2. Click Browse Catalog.
- 3. Select your analysis, then click **More** and select **Add to Briefing Book**.

Or, find your dashboard and click Open.

- a. Go to the dashboard page you want to add.
- **b.** Click the **Page Options** button and select **Add to Briefing Book**.
- 4. Indicate if you want the analysis or dashboard results to change (**Updatable**) or not (**Snapshot**) whenever the briefing book is downloaded or rerun.

Downloading and Editing Briefing Books

Follow these steps:

- 1. Open the Reports and Analytics work area, or the Reports and Analytics pane if available in other work areas.
- 2. Click Browse Catalog to locate your briefing book.

You can find briefing books only in the BI catalog.

Scheduling Analytics and Reports

Setting Reports Up to Run as Scheduled Processes: Points to Consider

You can create a job definition for predefined or custom reports so that users can run them as scheduled processes. Use the Define Custom Enterprise Scheduler Jobs task in the Setup and Maintenance work area to create job definitions. Otherwise, users can open reports (which are set up to be run online) through the Reports and Analytics pane, or open and schedule them from the business intelligence catalog.

General Job Definition Information

This table describes the general information to enter for your job definition.

Field	What You Enter
Job Type	BIPJobType
Report ID	The path to the report in the catalog, starting with the folder beneath Shared Folders, for example: Custom/ <family name="">/ <product name="">/<report file="" name="">.xdo. Make sure to include the .xdo extension for the report definition.</report></product></family>
Default Output	A default output format.

Parameters

You can define parameters to be available to users when they submit scheduled processes based on your job definition. When users run the scheduled process, the values they enter for the parameters:

- Are passed to the data model that the report is using.
- Determine the data to be included in the report.

The parameters that you define must be in the same order as parameters in the data model. For example, the data model has parameters in this order:

- P_START_DATE
- P_END_DATE
- P_CURRENCY

You create parameters as follows:

- Start Date
- End Date
- Currency
- Note: Because you define parameters using the list of values sources from the Define Custom Enterprise Scheduler Jobs task, you should not define lists of values in the data model.

User Property

The only user property you need to define is **EXT_PortletContainerWebModule**. Only lists of values associated with the application that you select are made available for parameters in this job definition.

Setting Reports Up for Scheduling in the Reports and Analytics Pane: Procedure

You can set up reports as scheduled processes, which means users can submit them from the Scheduled Processes and other work areas. If you want users to also submit these scheduled processes from the Reports and Analytics pane, then you must configure properties for the corresponding reports.

Enabling a Report for Scheduling

To enable scheduling in the Reports and Analytics pane:

- 1. Select the report in the business intelligence catalog and click **Edit**.
- 2. Click Properties.
- 3. On the General tab in the Properties dialog box, enter the following fields:

Field	Value
Enterprise Scheduler Job Package Name	The path for the job definition, for example: / oracle/ apps/ ess/ <pre>cproduct family>/ <pre>cproduct>/</pre></pre>
Enterprise Scheduler Job Definition Name	The job definition name (not display name), for example: ABCDEFG

Scheduling Analytics and Briefing Books: Procedure

Analytics and briefing books can run based on a schedule that you define. You can set up other automated tasks, for example to deliver results to specific recipients or send notifications. You create what's called an agent to set this all up for an analysis, dashboard, or briefing book. The agent itself is saved as an object in the business intelligence (BI) catalog.

Creating an Agent

- 1. Open the Reports and Analytics work area, or the Reports and Analytics pane if available in other work areas.
- 2. Click the **Browse Catalog** button.
- 3. Click New and select Agent under Actionable Intelligence.
- 4. Ensure that you enter information on the Delivery Content tab to specify the analysis, dashboard, or briefing book to run.
- 5. Save the agent in My Folders.
- Note: To edit an agent, browse the BI catalog to find the agent.

Scheduling Reports: Procedure

Reports can run based on a schedule that you define. You can set up other automated tasks, for example to deliver results to specific recipients or send notifications. You submit a report with the schedule and criteria for other automated tasks defined.

If a report is set up as a scheduled process, you submit the process as you would any scheduled process. You can schedule them from:

- Any work area where there's a link to the report.
- The Scheduled Processes work area, where you can submit all processes that you have access to.
- The Reports and Analytics work area or pane, if the report is set up for submission from there.

Submitting a Report or Scheduled Process

Follow these steps:

- Open the Reports and Analytics work area, or the Reports and Analytics pane if available in other work areas where
 you can find the report.
- 2. Click the name of your report.
- 3. Click **Schedule** if the option is there. The report is set up as a scheduled process.
 - a. Enter any parameters to avoid unnecessarily large results.
 - **b.** Click **Advanced** to enter a schedule, deliver results to a specific destination (including e-mail or printer), or define criteria for sending notifications.
- 4. If you don't see **Schedule**, then click **View**.
 - a. Click the **Actions** button for the report and select **Schedule**.
 - **b.** Enter information similar to step 3.

Adding Analyses to Application Pages

Creating and Editing Analyses Using a Wizard: Procedure

You can use a wizard that guides you through creating and editing analyses. Even though the wizard doesn't give you all available features, you can still use it to make typical changes, for example adding views or filters. For other tasks, such as creating dashboards or deleting analyses, use the advanced business intelligence features.

Creating an Analysis

- 1. Open the Reports and Analytics work area, or the Reports and Analytics pane if available in other work areas.
- 2. Click Create and select Analysis.
- 3. Select the subject area that has the columns you want for your analysis.
- 4. Optionally, add more subject areas or remove any that you no longer need.
- 5. Select the columns to include, set options for each column, and click Next.
- 6. Optionally, enter a title to appear at the top of the analysis, above the analysis name that you enter in the last step.
- 7. Select the type of table or graph to include, specify the layout of the views, and click Next.
 - Note: At any point after this step, you can click Finish to go to the last step, to save your analysis.
- 8. Optionally, set more options for the table or graph, and click **Next**.
- 9. Optionally, add sorts or filters based on any of the columns you included, and click Next.
- 10. If you have a table, optionally define conditional formatting for select columns, for example to display amounts over a certain threshold in red. Click Next.
- 11. Enter the name of your analysis and select a folder to save it in.
- 12. Click Submit.

Editing an Analysis

- 1. Open the Reports and Analytics work area, or the Reports and Analytics if available in other work areas where you can find the analysis.
- 2. Select your analysis in the pane and click Edit.
- 3. Perform steps 4 through 10 from the preceding Creating an Analysis task, as needed.
- **4.** To update an existing analysis, select the same name in the same folder. To save this analysis as a new copy, either name it with a new name or save it in a new folder.
- 5. Click Submit.

Creating a Supplier Purchase Order Analysis: Worked Example

This example demonstrates how to create an analysis that shows details of the purchase orders for a specific supplier.

The following table summarizes key decisions for this scenario.

Decisions to Consider	In This Example
Which subject area to use?	Procurement - Purchasing Real Time

Decisions to Consider	In This Example
What columns to include?	Year, Business Unit, Supplier, Name, Payment Terms, Order, UOM, Line, Ordered Quantity, Purchase Order Distribution Amount
Which layout to use?	Table
Does the report need sections?	No
Does the report need highlighting?	Highlight ordered quantity above 1000 in green and below 20 in red.

Creating The Analysis

- 1. Navigate to the Reports and Analytics work area.
- 2. On the Create Analysis: Select Columns page, expand the Procurement Purchasing Real Time folder.
- 3. Click Create and select Analysis if not already selected.
- 4. In the Select Subject Area window, select the Procurement Purchasing Real Time subject area.
- 5. Expand the Time Approved Date folder.
- 6. Select Year and click the Add button to move the column to the Selected Columns area.
- 7. Expand the Procurement BU folder.
- 8. Select Business Unit and move it to the **Selected Columns** area.
- 9. Expand the Supplier Profile folder.
- 10. Select Supplier and move it to the **Selected Columns** area.
- 11. Expand the Supplier Contact folder.
- 12. Select Name and move it to the **Selected Columns** area.
- 13. Expand the Payment Terms folder.
- **14.** Select Payment Terms Name and move it to the **Selected Columns** area.
- 15. Expand the Purchase Order Header Detail folder.
- 16. Select Order and move it to the **Selected Columns** area.
- 17. Expand Purchase Order Lines, then expand the Purchase Order Line Detail folder.
- 18. Select UOM and move it to the Selected Columns area.
- 19. In the same folder select Line move it to the **Selected Columns** area.
- 20. Expand Purchase Order Lines, then expand the Purchase Order Line folder.
- 21. Select Ordered Quantity and move it to the Selected Columns area.
- **22.** Expand Purchase Order Distributions, then expand the Purchase Order Distribution folder.
- 23. Select Purchase Order Distribution Amount and move it to the **Selected Columns** area.
- 24. Click Next.
- 25. On the Create Analysis: Select Views page, enter "Supplier Purchase Order Analysis" in the Title field.
- 26. Next to the Table field, click None to open the Table menu.
- 27. Select Table (recommended).
- 28. Check the box for **Preview**.
- 29. Click Next.
- **30.** On the Create Analysis: Edit Table page, click **Next**.
- **31.** On the Create Analysis: Edit Graph page, in the Sort region click **Add Sort**.
- 32. Select Order, then Ascending.
- 33. In the Filter region click Add Filter.
- 34. Select Supplier, then Allied Manufacturing in the Value column.
- 35. Click Next.

- **36.** Open the choice list for **Add Column Format** and select Ordered Quantity.
- 37. Now enter 20 for the first Threshold and 1000 for the second Threshold.
- Click Next
- **39.** On the Create Analysis: Save page, Save In region, enter "PO Details for Allied Manufacturing" in the Analysis Name field, enter a description, and then select **My Folders**.
- 40. Click Submit.
- **41.** In the Confirmation window, click **OK**.
- **42.** Expand My Folders to locate your analysis.
- 43. Select your report and click View.
- 44. Review your analysis.

Creating and Editing Analyses with Advanced Features: Procedure

Even though you can use a wizard to create or edit analyses, you might have to use advanced features for complicated analyses or specific requirements. For example, you can create view selectors so that users can toggle between views within an analysis, or define criteria for filters using SQL statements.

You can also perform other actions on analyses, for example delete them or copy and paste them within the business intelligence catalog.

Creating or Editing an Analysis

- 1. Open the Reports and Analytics work area, or the Reports and Analytics pane if available in other work areas.
- 2. Click the Browse Catalog button.
- Click the New button, select Analysis under Analysis and Interactive Reporting, and select a subject area.Or, select your analysis in the Folders pane and click Edit.
- 4. Use the tabs as described in this table.

Tab	Task	
Criteria	Select and define the columns to include.	
	Add filters.	
Results	Add views and set options for results.	
Prompts	Define prompts to filter all views in the analysis.	
Advanced	View or update the XML code and logical SQL statement that the analysis generates.	
	Set options related to query performance.	

5. Save your analysis.

Performing Other Actions on an Analysis

- 1. Open the Reports and Analytics work area, or the Reports and Analytics pane if available in other work areas where you can find the analysis.
- 2. Select your analysis in the pane and click **More**.

3. Click More for your analysis and select the desired action, for example Delete or Copy.

Adding an Analysis to the Procurement Dashboard: Worked Example

This example shows how to add an analysis to the Procurement dashboard. This dashboard is a page in the application, not a dashboard in the business intelligence (BI) catalog.

You can add predefined or custom analyses to any desktop page that you can personalize or customize.

The following table summarizes key decisions for this scenario.

Decisions to Consider	In This Example
Which analysis do you want to add?	Negotiated Award Amount and Savings by Category
	Ensure that the analysis isn't querying against a large volume of records. If it is, then the Procurement dashboard can take a long time to open after you add the analysis.
Do you have to change the layout of the page?	Yes, to a two-column layout that is wider on the right side.
	The one- or two-column layout gives enough space to properly display analyses.
Do you want all or only one view of the analysis?	All views.
Are these changes for you only, or for all users of the Procurement dashboard?	You only.

Adding an Analysis to the Procurement Dashboard

- 1. Open the Procurement dashboard.
- 2. Click your name in the global area and select Edit Current Page.
- 3. Click Change Layout and select Two columns, narrow left.
- 4. Click Add Content for the wider column.

The **Reports and Analytics** folder in the Add Content dialog box contains what's in the BI catalog.

5. Click through the folders in the catalog until you see the name of the analysis, and click **Add** to include all views of the analysis.

If you instead click **Open** or **Negotiated Award Amount and Savings by Category**, you can select a specific view to add.

- **6.** Click **Close** after you see the analysis added to the top of the wider column on the dashboard.
- 7. Click Save and then Close.

8 Maintenance and Migration

Performance Tuning for Analytics and Reports: Points to Consider

When you create analytics and reports, don't use blind queries and include sufficient filters when creating analytics or reports with hierarchies.

Blind Queries

Avoid blind queries because they are performed without filters and therefore fetch large data sets. Performance could be an issue with these queries and can easily overload the application. All Transactional Business Intelligence queries on large transaction tables must be time bound. For example, include a time dimension filter and additional filters to restrict by key dimensions such as worker. In addition, apply filters to columns that have database indexes in the transaction tables. This ensures a good execution plan is generated for the Business Intelligence query.

Hierarchies and Trees in Transactional Business Intelligence

Queries on trees and hierarchical dimensions such as manager can have an impact on performance. Transactional Business Intelligence uses a column-flattening approach to quickly fetch data for a specific node in the hierarchy. Still, because there is no pre-aggregation for the different levels of the hierarchy, carefully craft any query involving hierarchies to ensure that sufficient filters are applied to keep the result set small.

Reviewing SQL Statements Used in Analyses: Procedure

You can review the SQL statement using either of the following procedures.

Using Analysis in Edit Mode

- 1. Open the analysis in Edit mode and click the Advanced tab.
- 2. In the SQL Issued section, review the logical SQL statement.

Using Administration Page

- 1. On the Administration page, in the Session Management section, click the Manage Sessions link.
 - Note: You must be a Business Intelligence Administrator to access the Administration and Manage Sessions page.
- 2. On the Manage Sessions page, in the Action column, click the View Log link to review the SQL statement.

Moving Analyses and Reports: Procedure

You can archive to bundle the entire catalog, specific folders, or multi component objects as a .catalog file and upload the .catalog file to unarchive the data to another location in the catalog. Use the archive process to transfer specific data across environments, for example from a development environment to a production environment.

Creating an Archive

To create an archive file:

- 1. Locate the object in the catalog.
- 2. Select More and then select Archive.
- 3. In the Archive dialog box, select one or more of the following options:
 - Keep Permissions: Maintain the object or folder's existing permissions. If you do not select this option, then
 the archiving process does not include any permissions. Upon unarchiving, the parent folder's permissions are
 assigned to all of the objects and folders.
 - Keep Time stamps: Maintain the Creation Time, Last Modified, and Last Accessed times assigned to the object or folder. Upon unarchiving, the LastModified time is updated to indicate the time at which the object or folder is unarchived. If you select this option, the Old option in the Paste Overview area of the Preferences dialog box is available when unarchiving. You use the Old option to overwrite existing catalog items that are older than the catalog items in the archive.
 - If you do not select this option, then the archiving process does not include time information and the Old option in the Paste Overview area of the Preferences dialog box is not available.
- 4. Click **OK** to download the archive file.

Moving a File to a New Location

To unarchive a file:

- 1. Select the folder in the catalog where you want to upload the archived file.
- 2. In the **Tasks** pane click **Unarchive**.
- 3. In the Unarchive dialog box, browse for and select the archive file.
- **4.** Use the Replace option to specify whether to replace an existing folder or object with the same name.
 - All: Select this option to replace any existing folders or objects with the same names as folders or objects included in the archive file that you are uploading.
 - Old: Select this option to replace folders or objects except those folders or objects that exist, unless they are older than the source.
 - o None: Select this option to add any new folders or objects, but preserve any existing folders or objects.
 - Force: Select this option to add and replace all folders or objects.
- 5. Use the ACL option to specify how the folders or objects are assigned permissions using Access Control Lists (ACLs) when unarchived.
 - o Inherit: Inherits the folder or object's permissions (ACL) from its new parent folder.
 - Preserve: Preserves the folder or object's permissions (ACL) as it was in the original, mapping accounts as necessary.

- o Create: Preserves the folder or object's permissions (ACL) as it was in the original, creating and mapping accounts as necessary.
- 6. Click OK.

Glossary

analysis

A selection of data displayed in one or more views, such as a table or chart, to provide answers to business questions.

analytics

Business intelligence objects such as analyses and dashboards that provide meaningful data to help with decision making.

briefing book

A collection of static or updatable analyses or dashboard pages that you can download, print, and share with others.

business intelligence catalog

The repository where all business intelligence objects, including analytics, reports, briefing books, and agents, are stored. The catalog contains separate folders for personal, shared, and custom objects.

business intelligence repository

The metadata that determines all of the columns, or pieces of data, that you can include in analytics. You can also use the repository as a source of data for reports.

customization

A change to the predefined artifacts of the application. Customizations impact multiple users.

dashboard

A collection of analyses and other content, presented on one or more pages to help users achieve specific business goals. Each page is a separate tab within the dashboard.

data model

The metadata that determines where data for a report comes from and how that data is retrieved.

desktop page

A page that's optimized for extended periods of use with monitors.

EDI

Abbreviation for electronic data interchange.

EFT

Acronym for Electronic Funds Transfer. A direct transfer of money from one account to another, such as an electronic payment of an amount owed a supplier by transferring money from a payer's disbursement bank account into the supplier's bank account.

flexfield

A flexible data field that you can customize to contain one or more segments or store additional information. Each segment has a value and a meaning.

flexfield segment

An extensible data field that represents an attribute and captures a value corresponding to a predefined, single extension column in the database. A segment appears globally or based on a context of other captured information.

global area

The region at the very top of the user interface that remains the same no matter which page you're on.

job definition

The metadata that determines what a job does and what options are available to users when they submit the scheduled process. A job is the executable for a scheduled process.

panel tab

A tab on the right side of the page that slides out when you open it. Each panel tab has an icon as the tab label.

personalization

A change that users make to control the look or behavior of the application. Personalizations impact only the user making the change.

prompt

A parameter that you set when you use analytics, limiting the data in the analysis or in all analyses on the dashboard or dashboard page (tab).

regional area

The collapsible region in the work area that lets you control what's in the local area, for example by selecting a task or running a search.

report

An output of select data in a predefined format that's optimized for printing.

role

Controls access to application functions and data.

scheduled process

A program that you run to process data and, in some cases, generate output as a report.

subject area

A set of columns, or pieces of data, related to a specific business object or area.

view

A specific way to present the results of an analysis, for example as a table or graph. Other types of views, such as the title view, show other components of the analysis.

work area

A set of pages containing the tasks, searches, and other content you need to accomplish a business goal.
